

Amendments to the Claims:

This listing of claims will replace all prior versions, and listings, of claims in the application:

LISTING OF THE CLAIMS:

1-12. (Cancelled)

13. (Preciously Presented) A method of real-time encoding a digitized sequence of video frames using a codec with high compression efficiency, comprising steps of:

- dividing a video frame into macroblocks of pixels;
- performing texture prediction using reconstructed texture of previously encoded/decoded video data;

- performing a texture prediction error transform; and
- performing quantization and encoding of DCT transform coefficients;

wherein quantization of DCT transform coefficients is performed using the following formula:

$$q = (c \cdot A (Quantstep) + round_const) / 2^{20};$$

where c- coefficient value;

q -quantized coefficient value;

A- a constant depending on quantization parameter index;

round_const - rounding control: $0.5 \operatorname{sign}(c)$, if $|c| < 20 \cdot 2^{20}/A (Quantstep)$

and $0.25 \operatorname{sign}(c)$, if $|c| \geq 20 \cdot 2^{20}/A (Quantstep)$.

14. (Original) The method of claim 13, comprising a step of downscaling before encoding of the video frame using bilinear interpolation.

15. (Original) The method of claim 13, comprising a step of controlling parameters of encoded frames.

16. (Original) The method of claim 13, comprising a step of controlling frame encoding time and CPU load.

17. (Original) The method of claim 13, comprising a step of selecting best parameters and encoding mode for macroblock coding based on preset coding parameters and codec working parameters.

18. (Original) The method of claim 13, comprising a step of noise suppression.

19. (Original) The method of claim 17, wherein the encoding mode is a low-complexity 3-dimensional data coding.

20. (Original) The method of claim 17, wherein the encoding mode is motion compensation.

21. (Original) The method of claim 20, wherein frame encoding starts with choosing a best prediction mode.

22. (Original) The method of claim 21, wherein the prediction mode is inter prediction mode predicting block pixels using reconstructed texture of previously coded/decoded frames and specifying block motion vectors.

23. (Original) The method of claim 21, wherein the prediction mode is intra prediction mode predicting block pixels using reconstructed texture of previously coded/decoded blocks of current frame and specifying prediction method.

24. (Original) The method of claim 23, comprising wavelet transform, wherein resulting wavelet transform coefficients are compressed by context-based entropy coding.

25. (Original) The method of claim 24, wherein uniform quantization with constant step size is applied to all wavelet transform coefficients.

26. (Previously Presented) A method of real-time encoding a digitized sequence of video frames using a codec with high compression efficiency, comprising steps of:

- dividing a video frame into macroblocks of pixels;
 - performing texture prediction using reconstructed texture of previously encoded/decoded video data;
 - selecting best parameters for macroblock encoding based on preset coding parameters and codec working parameters for macroblock coding;
 - selecting intra prediction mode predicting block pixels using reconstructed texture of previously coded/decoded blocks of current frame and specifying prediction method;
 - selecting motion compensation mode for macroblock encoding;
 - performing a texture prediction error transform; and
 - performing quantization and encoding DCT transform coefficients using wavelet transform,
- wherein resulting wavelet transform coefficients are compressed by the context-based entropy coding is based on contexts including three neighboring coefficients and one root coefficient, the value of each coefficient being coded arithmetically, and the context-based entropy coding of absolute value of transform coefficients is determined in accordance with the following algorithm:
- set a current value of coefficient = 0;
 - construct bits of context for entropy-coded binary value:
 - bit 0 = $\text{abs}(n1) > \text{current value}$, where $\text{abs}(n1)$ is absolute value of the first neighboring coefficient;

bit 1 = $\text{abs}(n2) > \text{current value}$, where $\text{abs}(n2)$ is absolute value of the second neighboring coefficient;

bit 2 = $\text{abs}(n3) > \text{current value}$, where $\text{abs}(n3)$ is absolute value of the third neighboring coefficient;

bit 3 = 0 (root coefficient = 0);

bits 4,5 = $(\text{abs}(n3) * 3 + \text{abs}(n1) * 3 + \text{abs}(n2) * 2 + 4) / 8 = \{0, 1, 2, 3 \text{ or greater}\}$;

- using the context, send bit "1" if $\text{abs}(\text{coefficient}) = \text{current value}$, otherwise send bit "0";
 - increment the current value;
 - if $\text{abs}(\text{coefficient}) \neq \text{current value}$, repeat the construct step;
 - if $\text{abs}(\text{coefficient}) > 0$, sent a sign,
- wherein the bits of context number are: Bit 0 = $(n1 > 0)$; Bit 1 = $(n3 > 0)$.

27. (Previously Presented) A method of real-time encoding a digitized sequence of video frames using a codec with high compression efficiency, comprising steps of:

- dividing a video frame into macroblocks of pixels;
- performing texture prediction using reconstructed texture of previously encoded/decoded video data;
- selecting best parameters for macroblock encoding based on preset coding parameters and codec working parameters;
- selecting motion compensation mode for macroblock encoding;
- selecting inter prediction mode for frame encoding predicting block pixels using reconstructed texture of previously coded/decoded blocks of current frame and specifying prediction method,
- performing a texture prediction error transform;
- encoding DCT transform coefficients using wavelet transform,
- compressing resulting wavelet transform coefficients by context-based entropy coding, and

applying an uniform quantization with constant step size to all wavelet transform coefficients;

wherein the uniform quantization of transform coefficients is presented as follows:

$$q_Coeff = \text{round} (Coeff / Quantizer),$$

wherein **Coeff** – wavelet transform coefficient;

q_Coeff – quantized coefficient;

Quantizer – quantization step size.

28. (Previously Presented) The method of claim 27, comprising step of motion estimation for calculating-components of motion vectors.

29. (Original) The method of claim 28, wherein the motion vectors are calculated with quarter-pel accuracy.

30. (Previously Presented) A method of real-time encoding a digitized sequence of video frames using a codec with high compression efficiency, comprising steps of:

- dividing a video frame into macroblocks of pixels;
- performing texture prediction error transform;
- selecting best parameters for macroblock coding based on preset coding parameters and codec working parameters;
- selecting motion compensation mode for encoding;
- performing a texture prediction error transform;
- performing quantization and encoding of DCT transform coefficients; and
- performing calculation of components of motion vectors using motion estimation, wherein the motion estimation comprises:
 - calculating motion vectors $MV(wb, hb, CF, RF)$ with integer-pel accuracy using previously calculated motion data;

calculating motion vectors $MV(wb, hb, CF, RF)[block_x][block_y]$ performing inverse logarithmic motion search with parameters $block_x, block_y, current_range$;

performing motion vector refinement choosing from sets of neighboring motion vectors $MVNeighborhood(wb, hb, CF, RF)[block_x][block_y]$ elements (mvx, mvy) that provide minimum value of motion vector weight function $Q(mvx, mvy, CF, RF, wb, hb, block_x, block_y)$;

performing motion vector estimation with quarter-pel accuracy based on results of motion vector estimation with integer-pel accuracy by changing components of the integer-pel accuracy motion vector $MV(wb, hb, CF, RF)[block_x][block_y]$ in range $[-3/4; +3/4]$ with a step $1/4$; and

calculating motion vectors $MV(wb, hb, CF, RF)$ with quarter-pel accuracy by sequentially applying the motion estimation steps with integer-pel accuracy and with quarter-pel accuracy,

wherein CF - current frame with horizontal coordinate x and vertical coordinate y ;

RF - reference frame with horizontal coordinate x and vertical coordinate y ;

wb - width of the blocks for which motion estimation is performed;

hb - height of the blocks for which motion estimation is performed;

W - a multiple of wb , current and reference frame width;

H - a multiple of hb , current and reference frame height;

$Q(mvx, mvy, CF, RF, wb, hb, block_x, block_y)$ - motion vector weight calculation function;

$MV(wb, hb, CF, RF)[block_x][block_y]$ - motion vector (i.e. pair (mvx, mvy) of integers) corresponding to the frame CF and reference frame RF for a block of width wb , height hb , which left-top corner is located at a pixel with horizontal coordinate $block_x$ and vertical coordinate $block_y$;

$MV(wb, hb, CF, RF)$ - a set of motion vectors $MV(wb, hb, CF, RF)[block_x][block_y]$ for: $block_x=0, wb, 2 \cdot wb, 3 \cdot wb, \dots, block_x < W$, and $block_y=0, hb, 2 \cdot hb, 3 \cdot hb, \dots, block_y < H$.

$MVNeighborhood(wb, hb, CF, RF)[block_x][block_y]$ - a set of neighboring motion vectors $MV(wb, hb, CF, RF)[nx][ny]$, where nx may be equal to $block_x - wb$, $block_x$, $block_x + wb$, and ny may be equal to $block_y - hb$, $block_y$, $block_y + hb$, and $nx \geq 0$, $ny \geq 0$, $nx \leq W - wb$, $ny \leq H - hb$.

31. (Original) The method of claim 28, comprising step of arithmetic encoding of motion vector prediction difference.

32. (Cancelled)

33. (Original) The method of claim 13, wherein encoding of DCT transform coefficients is performed by arithmetic coding based on two-dimensional contest/position-depending modeling.

34. (Original) A method of decoding of sequence of video frames encoded according to claim 13, comprising steps of:

- arithmetic decoding;
- decoding coded block pattern of macroblock mode and texture using arithmetic context-based modeling;
- decoding texture prediction error using arithmetic context-based modeling;
- calculating prediction for motion vectors; and
- decoding motion vectors using context-based arithmetic modeling.

35. (Original) The method of decoding of claim 34, comprising internal bilinear upscaling correlated with bilinear downscaling provided at the time of encoding.

36. (Original) The method of decoding of claim 34, wherein the texture prediction error is provided by inverse transform and dequantization correlated with corresponding encoding procedures.

37. (Original) The method of decoding of claim 34, comprising step of deblocking of decoded video frame using at least one of horizontal and vertical deblocking passes for smoothing of sequence of video frame border points.
